Agenda
Annual Public Workshop
San Onofre Nuclear Generating Station Wetland Mitigation Project
June 18, 2020

1:30 – 1:40  Introduction and Overview – Steve Schroeter, UCSB
1:40 – 2:10  Performance of the San Dieguito Wetlands Restoration Project – Mark Page, UCSB
2:10 – 2:25  Questions and Comments on Monitoring Results
2:55 – 3:15  General Discussion

For more information go to: http://marinemitigation.msi.ucsb.edu/
Introduction
Annual Review Workshop for SONGS Wetland Mitigation

June 18, 2020
SONGS Mitigation Monitoring Project
Marine Science Institute, University of California Santa Barbara
Some background is important for understanding the purpose and rationale for the SONGS wetland mitigation project.

The SONGS reactors were cooled by a single pass seawater system.

Units 2 and 3 have separate intake lines that are located in about 30 feet of water offshore of the power plant.

Power plant heated cooling water and turbulence kills fish eggs, larvae and small immature fish.

SONGS operations projected to cause substantial reductions in populations of adult nearshore fish in the Southern California Bight.

Power plant heated cooling water and turbulence was found to kill fish eggs, larvae and small immature fish; these losses were projected to cause substantial reductions in populations of adult fish in the Southern California Bight.

Construction of Units 2 and 3 was found to be consistent with the Coastal Act only if these significant adverse impacts to fish would be mitigated.
The California Coastal Act requires the mitigation of impacts to the marine environment.

Enforcement of the Coastal Act resides with the California Coastal Commission (CCC).

As mitigation for the impacts to larval and juvenile fish caused by SONGS the CCC required SCE to:

- Create or substantially restore a minimum of 150 acres of wetlands, excluding buffer zone and upland transition area.
- Provide funding for scientific oversight and monitoring of the restoration project that is independent of SCE.
Key Elements of the SONGS Wetland Mitigation Project

• Out-of-kind compensation for in-plant losses of larval and juvenile fish caused by the operation of SONGS Units 2 & 3.

• Physical and biological standards were established to evaluate the performance of the wetland restoration project.

• One year of mitigation credit is given for each year that the San Dieguito Wetlands Restoration Project meets the performance standards.

• Fulfillment of the SONGS wetland mitigation requirement occurs when the number of years of mitigation credit accrued by the San Dieguito Wetlands Restoration Project equals the total years of operation of SONGS Units 2 & 3, including the decommissioning period to the extent that there are continuing discharges.

To summarize key elements of the SONGS Wetland Mitigation Project:

• The mitigation project is out-of-kind compensation for in-plant losses of larval and juvenile fish caused by the operation of SONGS Units 2 & 3.

• Physical and biological standards were established to evaluate the performance of the wetland restoration project to ensure that the restored wetland provides ecosystem functions that are similar to relatively undisturbed tidal wetlands in the region.

• One year of mitigation credit is given for each year that the San Dieguito Wetlands Restoration Project meets the performance standards.

• Fulfillment of the SONGS wetland mitigation requirement occurs when the number of years of mitigation credit accrued by the San Dieguito Wetlands Restoration Project equals the total years of operation of SONGS Units 2 & 3, including the decommissioning period to the extent that there are continuing discharges.
• This slide provides a timetable of SONGS operations.
• Operations of SONGS Units 2 and 3 were suspended in January 2012 due to premature wear of components of replacement steam generators.
• SCE decided to permanently cease power operations in June 2013
• SCE’s operating license has been modified to “possession only” and they are no longer authorized to operate the reactors
This map shows the locations of SONGS, the impact site, the San Dieguito Lagoon, site of the San Dieguito Wetlands Restoration Project, and 3 wetlands that are used as reference sites to evaluate the performance of the restoration project: Carpinteria Salt Marsh, Mugu Lagoon, and Tijuana Estuary.
• This slide shows a satellite view of the project site before excavation and grading.
• You can see the San Dieguito River and adjoining ruderal upland, including the site of an old WWII airfield, and old agricultural fields.
• You can also see a portion of a basin that was constructed in the 1980’s termed the Fish and Game Basin.
• During construction, the ruderal areas and old agricultural fields were excavated and graded to create the planned intertidal and subtidal wetland habitats of the restoration project visible in this image taken in 2016.
• In addition, you can see nesting sites that are not part of the mitigation requirement, and upland disposal sites that received the majority of the ~2.2 million yd3 of material excavated during construction.
This slide summarizes the project timeline.

- Construction began in September of 2006.
- Wetland construction was organized by area and module -- most excavation and grading was completed by 2008, with the addition of tidal creeks in W2/3 completed in November 2010, and re-grading of this area to lower elevations in March 2014.
- Large scale planting of salt marsh plants, including cordgrass, Spartina in the low marsh was completed in 2011, with some additional planting in high marsh in 2016, 2017, 2018.
- Inlet channel dredging was completed in September 2011, with follow-up maintenance dredging in November/December of 2015, 2017, and 2019.
- Performance monitoring began in the year 2012, following the initial September 2011 dredging.
- We are now in the eighth year of performance monitoring.

Following construction, annual monitoring is required to evaluate the physical and biological performance standards provided in the SONGS permit.

Monitoring tracks ecosystem development and identifies adaptive management opportunities pertaining to physical and biological functioning of the wetland.

Independent monitoring is conducted by scientists from UCSB with advice from a Science Advisory Panel.

- Following construction, annual monitoring is required to evaluate the physical and biological performance standards provided in the SONGS coastal development permit.
- Monitoring also tracks ecosystem development and identifies adaptive management opportunities pertaining to the physical and biological functioning of the wetland.
- Independent monitoring is conducted by scientists from UCSB with advice from a Science Advisory Panel.
In the eighth year of monitoring, the restored wetland is providing habitat for an array of invertebrates, fish, and birds, and wetland plants.
• This includes the provision of nursery habitat for juvenile California Halibut, and habitat for the endangered Ridgway’s Rail and Belding’s Savannah Sparrow, as well for rare visitors such as the Eurasian Widgeon.

• Although the wetland is providing resource value it has not met the performance criteria required for successful mitigation, which will be discussed in the next presentation that reviews the results from performance monitoring in 2019.
